38.
$$\begin{bmatrix} n+1 \\ m+1 \end{bmatrix} = \sum_{k} \begin{bmatrix} n \\ k \end{bmatrix} \binom{k}{m} = \sum_{k=0}^{n} \begin{bmatrix} k \\ m \end{bmatrix} n^{\frac{n-k}{2}} = n! \sum_{k=0}^{n} \frac{1}{k!} \begin{bmatrix} k \\ m \end{bmatrix},$$
 39. $\begin{bmatrix} x \\ x-n \end{bmatrix} = \sum_{k=0}^{n} \left\langle \!\! \begin{pmatrix} n \\ k \end{pmatrix} \!\! \right\rangle \binom{x+k}{2n},$

40.
$$\binom{n}{m} = \sum_{k} \binom{n}{k} \binom{k+1}{m+1} (-1)^{n-k},$$

$$\mathbf{41.} \quad \binom{n}{m} = \sum_{k} \binom{n+1}{k+1} \binom{k}{m} (-1)^{m-k},$$

42.
$${m+n+1 \brace m} = \sum_{k=0}^{m} k {n+k \brace k},$$

$$43. \begin{bmatrix} m+n+1 \\ m \end{bmatrix} = \sum_{k=0}^{m} k(n+k) \begin{bmatrix} n+k \\ k \end{bmatrix},$$

44.
$$\binom{n}{m} = \sum_{k} {n+1 \brace k+1} {k \brack m} (-1)^{m-k}, \quad \textbf{45.} \quad (n-m)! \binom{n}{m} = \sum_{k} {n+1 \brack k+1} {k \brack m} (-1)^{m-k}, \quad \text{for } n \ge m,$$

46.
$${n \choose n-m}^k = \sum_k {m-n \choose m+k} {m+n \choose n+k} {m+k \choose n+k} {m+k \choose n+k},$$
 47.
$${n \choose n-m} = \sum_k {m-n \choose m+k} {m+n \choose n+k} {m+k \choose n+k} {m+k \choose n+k},$$

48.
$${n \brace \ell + m} {\ell + m \choose \ell} = \sum_{k} {k \brace \ell} {n - k \brack m} {n \brack k},$$
 49.
$${n \brack \ell + m} {\ell + m \brack \ell} = \sum_{k} {k \brack \ell} {n - k \brack m} {n \brack k}.$$

Trees

Every tree with nvertices has n-1edges.

Kraft inequality: If the depths of the leaves of a binary tree are

$$d_1, \dots, d_n$$
:

$$\sum_{i=1}^{n} 2^{-d_i} \le 1,$$

and equality holds only if every internal node has 2 sons.

Recurrences

Master method:

$$T(n) = aT(n/b) + f(n), \quad a \ge 1, b > 1$$

If $\exists \epsilon > 0$ such that $f(n) = O(n^{\log_b a - \epsilon})$ then

$$T(n) = \Theta(n^{\log_b a}).$$

If
$$f(n) = \Theta(n^{\log_b a})$$
 then
$$T(n) = \Theta(n^{\log_b a} \log_2 n).$$

If $\exists \epsilon > 0$ such that $f(n) = \Omega(n^{\log_b a + \epsilon})$, and $\exists c < 1$ such that $af(n/b) \leq cf(n)$ for large n, then

$$T(n) = \Theta(f(n)).$$

Substitution (example): Consider the following recurrence

$$T_{i+1} = 2^{2^i} \cdot T_i^2, \quad T_1 = 2.$$

Note that T_i is always a power of two. Let $t_i = \log_2 T_i$. Then we have

$$t_{i+1} = 2^i + 2t_i, \quad t_1 = 1.$$

Let $u_i = t_i/2^i$. Dividing both sides of the previous equation by 2^{i+1} we get

$$\frac{t_{i+1}}{2^{i+1}} = \frac{2^i}{2^{i+1}} + \frac{t_i}{2^i}.$$

Substituting we find

$$u_{i+1} = \frac{1}{2} + u_i, \qquad u_1 = \frac{1}{2},$$

which is simply $u_i = i/2$. So we find that T_i has the closed form $T_i = 2^{i2^{i-1}}$. Summing factors (example): Consider the following recurrence

$$T(n) = 3T(n/2) + n$$
, $T(1) = 1$.

Rewrite so that all terms involving Tare on the left side

$$T(n) - 3T(n/2) = n.$$

Now expand the recurrence, and choose a factor which makes the left side "telescope"

$$1(T(n) - 3T(n/2) = n)$$

$$3(T(n/2) - 3T(n/4) = n/2)$$

$$\vdots \qquad \vdots \qquad \vdots$$

$$3^{\log_2 n - 1}(T(2) - 3T(1) = 2)$$

Let $m = \log_2 n$. Summing the left side we get $T(n) - 3^m T(1) = T(n) - 3^m =$ $T(n) - n^k$ where $k = \log_2 3 \approx 1.58496$. Summing the right side we get

$$\sum_{i=0}^{m-1} \frac{n}{2^i} 3^i = n \sum_{i=0}^{m-1} \left(\frac{3}{2}\right)^i.$$

Let $c = \frac{3}{2}$. Then we have

$$n \sum_{i=0}^{m-1} c^{i} = n \left(\frac{c^{m} - 1}{c - 1} \right)$$
$$= 2n(c^{\log_{2} n} - 1)$$
$$= 2n(c^{(k-1)\log_{c} n} - 1)$$
$$= 2n^{k} - 2n.$$

and so $T(n) = 3n^k - 2n$. Full history recurrences can often be changed to limited history ones (example): Consider

$$T_i = 1 + \sum_{j=0}^{i-1} T_j, \quad T_0 = 1.$$

Note that

$$T_{i+1} = 1 + \sum_{j=0}^{i} T_j.$$

Subtracting we find

$$T_{i+1} - T_i = 1 + \sum_{j=0}^{i} T_j - 1 - \sum_{j=0}^{i-1} T_j$$

= T_i .

And so
$$T_{i+1} = 2T_i = 2^{i+1}$$
.

Generating functions:

- 1. Multiply both sides of the equation by x^i .
- 2. Sum both sides over all i for which the equation is valid.
- 3. Choose a generating function G(x). Usually $G(x) = \sum_{i=0}^{\infty} x^i g_i$.
- 3. Rewrite the equation in terms of the generating function G(x).
- 4. Solve for G(x).
- 5. The coefficient of x^i in G(x) is g_i . Example:

$$q_{i+1} = 2q_i + 1, \quad q_0 = 0.$$

Multiply and sum:

$$\sum_{i\geq 0}^{\infty} g_{i+1} x^i = \sum_{i\geq 0} 2g_i x^i + \sum_{i\geq 0} x^i.$$

We choose $G(x) = \sum_{i \geq 0} x^i g_i$. Rewrite

$$\frac{G(x) - g_0}{x} = 2G(x) + \sum_{i \ge 0} x^i.$$

$$\frac{G(x)}{x} = 2G(x) + \frac{1}{1-x}.$$

Solve for
$$G(x)$$
:
$$G(x) = \frac{x}{(1-x)(1-2x)}.$$

Expand this using partial fractions:
$$G(x) = x \left(\frac{2}{1-2x} - \frac{1}{1-x} \right)$$
$$= x \left(2 \sum_{i \geq 0} 2^i x^i - \sum_{i \geq 0} x^i \right)$$
$$= \sum_{i \geq 0} (2^{i+1} - 1) x^{i+1}.$$

So
$$g_i = 2^i - 1$$
.
